Recursion is when a method in a program repeatedly calls itself whereas, iteration is when a set of instructions in a program are repeatedly executed. A recursive method contains a set of instructions, statement calling itself, and a termination condition whereas iteration statements contain initialization, increment, condition, set of instruction within a loop and a control variable.

Iteration: Iteration does not involve any such overhead. Infinite Repetition: Infinite Repetition in recursion can lead to CPU crash but in iteration, it will stop when memory is exhausted. Recursion : In Recursion, Infinite recursive calls may occur due to some mistake in specifying the base condition, which on never becoming false, keeps calling the function, which may lead to system CPU crash.

call stack, while iteration can be replaced with tail recursion. Which approach is preferable depends on the problem under consideration and the language used.

[Recursion \(computer science\) - Wikipedia](#)

Recursion and iteration are very similar concepts. Each term means that lines of code are repeated until a condition is met. Or they just run forever if that condition isn't met (infinite loop)....
